I have a static html file with animations and different html5 tags. Is it possible to include this file (will all resources, images, js) in a jekyll blog post/page. More specifically, from .md file can I use include tag to use my static html5 file. I am very new to both jekyll, markdown. thnx

An HTML file can be included in Jekyll like this:

```
{% include note.html %}
```

And it will load the file located at `_includes/note.html` . Or you can use relative directories to the one that is calling the include, for example, consider having `index.md` and we want to include another html file inside it called `note.html` :

Folder structure:

```
.
├── note.html
└── index.md
```

Then in `index.md` :

```
---
title: example
---

{% include_relative note.html %}
```

thnx, I was actually trying to find if there are ways to add html5 tags. I tried to include my file but all the formats got broken. – [jillionbug2fix](#) Mar 30, 2017 at 22:41

then you should include the code causing the problem – [marcanuy](#) Mar 30, 2017 at 22:49

Markdown doesn't allow all html tags, you can take a look [here](#) to see which html tags are allowed and how to type them in markdown

for animations if you can wrap your animation in a gif then you can use it in markdown like so

and if you want to add a still image like so
